

F06 | D0 versus D1 natural repetition distributions

Repair Without Rewrite / DEVELOPMENT evidence / seed 42

Record-balanced natural repair frequency mass (exact finite ledger counts)

Condition	Presentations per record	Number of records	Distinct-record denominator
D0	18	763	1,024
D0	19	261	1,024
D1	1	8,688	14,113
D1	2	5,425	14,113

Zero-presentation repair records: D0 = 0 D1 = 0

Repeated presentations are not independent new records; distinct-record denominators remain explicit.

Repair accounting and separate reference-as-source identity channel

Quantity	D0	D1
Distinct repair records	1,024	14,113
Repair presentations	18,693	19,538
Mean repair repetition	18.254883	1.384397
Repair canonical charge	1,000,665	1,000,628
Identity presentations (separate)	28,040	29,365
Identity repetition: records × presentations	632 x 27; 392 x 28	12,974 x 2; 1,139 x 3
Identity canonical charge	1,501,032	1,501,003
First full repair pass: ending total exposure	547,635	7,218,011
Charge-based repair pass equivalents	18.256312	1.386247

Phase charge table: repair and identity remain separate

Condition / phase	Repair presentations	Repair canonical charge	Identity presentations	Identity canonical charge
D0 P0	12,456	666,666	18,681	1,000,061
D0 P1	4,979	266,669	7,481	399,991
D0 P2	1,258	67,330	1,878	100,980
D1 P0	13,026	666,666	19,526	1,000,060
D1 P1	5,221	266,651	7,853	400,043
D1 P2	1,291	67,311	1,986	100,900

Exact repetition distributions were independently reaggregated in frontier v3. Detailed phase, identity and first-pass accounting retain narrower independent coverage. No sampling interval applies to these fixed ledger counts. D1 expands diversity at approximately fixed charge; useful transfer from more exposure remains unproved.
